Diesel Particulate Filters (DPF)
Bringing OE quality parts, training and technical support to the aftermarket.
Tail pipe emissions solutions for a greener tomorrow

Increasingly stringent emissions legislation continues to drive the demand for cleaner, greener and more fuel efficient vehicles.

Despite ground-breaking new technologies and modern electronic control devices that significantly aid in reducing engine-out exhaust emissions, NOx and carbon particulates are still the subject of environmental concern. Additional reduction in both is required in order to comply with upcoming changes to emission standards.

To meet these challenges, vehicle manufacturers around the globe are turning to diesel exhaust gas aftertreatment technologies. One such technology is the Diesel Particulate Filter, or DPF. Designed to remove diesel particulate matter or soot from the exhaust gas of a diesel engine, DPFs will become ever more important in helping to reduce the negative environmental and health effects of carbon particles and NOx.

A growing market…

This legislation has contributed to an extraordinary growth in the number of vehicles fitted with DPFs. From as early as 1998, they have been fitted to some of the most popular applications across Europe.

Today, they are commonplace on most new vehicles, and with the introduction of Euro 6 emissions legislation making aftertreatment systems mandatory, this trend is guaranteed to accelerate. In fact, by 2017, it is forecasted there will be over 10 million diesel vehicles fitted with a DPF and (SCR) Selective Catalytic Reduction System.

…and an increasingly profitable service opportunity

This rapidly growing parc of vehicles will all require expert diagnostics and servicing…presenting a significant service opportunity for workshops and garages trained in DPF technology, and equipped with the parts and specialist tools to do the job right. But are you ready?

Delphi is! And now you too can profit from this rapidly growing opportunity.

How? By choosing Delphi!
**Why Delphi?**

As a leading manufacturer of OE diesel injection and engine management technology, Delphi has an in-depth understanding of the entire system. From Common Rail to the latest emissions technology, Delphi provides the world’s top vehicle manufacturers with a complete system solution, helping to deliver optimal engine performance, improved fuel economy and reduced emissions.
A complete DPF solution, backed by a brand you can trust

Delphi offers more than just parts! It provides a complete DPF solution, including OE quality filtration media, training, technical support and diagnostics…

Diagnostics
Available on its DS and DIAMAND platforms, Delphi’s specialist diagnostic tools give the garage the capability to complete forced regeneration, diagnose and reset fault codes, as well as the ability to reset engine management warning lights.

Training
With classroom based courses and webinars, Delphi is able to provide technicians with comprehensive training, not only for the DPF, but also for the complete diesel system, keeping you up-to-date with the very latest developments, and giving you all the skills you need to service these systems.

Technical Support
Available to members of its network, Delphi’s technical support includes a dedicated hotline, manned by experienced Delphi engineers, as well as regular technical bulletins offering the very latest information.

Everything your business needs to take advantage of the DPF opportunity!
